Information->

Authors: Justin M. Vader and Alan N. Weiss

General Physical Examination and Cardiovascular Disease

- Overall appearance
 - Age, sex, and body habitus are important variables impacting cardiovascular disease risk and significantly influence first impressions of disease likelihood.
 - Findings of generalized distress such as agitation, diaphoresis, and vomiting may suggest states of high sympathetic or vagal tone and may portend worse pathology.
 - Stigmata of past interventions such as prior sternotomy scars, pacemaker or implantable cardioverter defibrillator, vascular access scars, and fistulae are particularly useful in the patient with limited ability to provide history.
 - Cardiovascular pathology is common in a variety of disease syndromes with characteristic examination findings

Pictorial information about the topic.

Congratulations!

You just completed the task of keeping up-to-date with the world of medicine and also used medical topic look ups about terms used in user or group interactions and the Medbeats channel.

Buzzpro

The ultimate collaboration, connectivity and productivity tool for Doctors and Health Care Professionals.

Your entire medical universe – now connected for your practice in one messenger app.

WhatsApp is for social interaction, not for highly specialised professionals like Doctors.
